Abstract:

The primary factor in the production of Labor is characterized. (because without a human cocktail, without its participation, without the most perfect machines, Ham, the items of livelihood cannot be created). Man is the Supreme producer of society. Material conditions are required for production.

Key words: development, educational institutions, great pedagogical value, sincere like-minded, expander.

In macroeconomics, production was determined by the ratio of the net product or fund created at the macroeconomic scale (at the enterprise) to the cost of the product, if it was measured by the yield to efficiency.

Although stability is achieved when economic growth efficiency is carried out on the ground of intensive methods, stability cannot become permanent, since disruptions in economic growth continue to be constant, transitions from one state to another. Such a state is called the periodicity of economic growth.

The rapid growth of economic growth in the economy, the rise in the level of gox inflation and baxo, that is, the stability of the economy, is called the cycle of economic growth.

The cycle is a period of oscillation that involves the periodic rise and fall patterns of the economy, described by the oscillation of the economy. The economic cycle, according to current theories, consists of 4 stages: these stages occur in series.

The basis of economic growth is material production. He is the source of not only the current extents of morality in society, but at the same time the increase in national wealth. What is national wealth? National wealth is the sum of material and spiritual benefits, consumer values, created by human cocktails during the development of human society and accumulated in the moboyrn of all historical development. Millyi wealth is the basis of Achaemenid marriage and spiritual level in society, the material basis of extended reproduction and the result of piety.

Millyi is characterized by the fact that the material goods that make up wealth are the result of a) part of a human cocktail, while b) the second part consists of natural resources of wealth involved in the production jaaryon. Natural resruses consist of socially owned land, forest, water, minerals. They serve as the main source for the creation of a part of the material goods of national wealth.

The material part of Millyi wealth is the result of a generational cocktail in jamitya, that is, a production and a productive cocktail.

Distinctive features of national wealth:

A) the fact that it is a cocktail specialty and increased.

B) go accumulative and be dressing repeatedly.

(G) the possession of persons as a certain property.

National wealth and its structural structure, the quality of the parts that make it up, is an important factor in social reproduction, the most important indicator of the economic power of the country. An increase in national wealth hajm is a condition of its Mukhim, an increase in the standard of living of the khaq. In the process of expanded reproduction, the national wealth is replenished and constantly updated, not only growing, but also newly created products. Thus, the result of economic progress occurs.

While part of the national wealth is spent as production resources, the second part is spent as a means of consumption.

The national wealth at the disposal of society, its productive resources make up the economic strength of this society, their economic good. Economic potential is a society's ability to produce. Such an ability is embodied in the created gross national product as a result of the end of production. The economic saloxiate achieved is the saloxiate used in aloxia, which indicates its level of production. The future salahiyat, on the other hand, is a fully used salahiyat, which assumes the maximum use of resources. The balance will exceed the balance achieved in the balance.

The economic potential consists of the methods in the quay: the cocktail potential, the tech-tech potential, the science (intellectual) and the natural salience are the productive part of the cocktail potential morality, the amount of which is made up by the number of people fit for work. And the quality depends on the level of knowledge of morality, professional and malaka experience. In developed countries, this method represents 20-25% of the share in ensuring economic growth.

Technique-technology potential consists of machines at the disposal of society, the amount of instrument equipment, their level and composition of technology and technology.

The natural potential is limited, consisting of land, water reserves, forest and subsurface Resources, Water Resources, climatic amenities. The difficulties and obstacles that arise due to the rarity of natural resources can be overcome in technical – technological potential assistance. For example: Japan compensates for the rarity of natural resources with its high technical-technological potential in aid. Uzbekistan has rich natural material and cocktail resources. The task is to use these resources wisely, economically and efficiently.

Economic activity and entrepreneurial activity have a certain relationship with each other: what is included in the content of entrepreneurial activity is inherent in any economic activity. At the same time, entrepreneurial activity is characterized by

a number of characteristic features, which makes it possible to talk about entrepreneurial activity as a narrower concept than economic activity.

Farm work is production

and the sale of products (works, services).

In the civil circulation of legal entities and individuals, independent entrepreneurial activity is recognized, which is carried out on its own behalf, under its own risk and property responsibility, and aimed at profiting from the use of property, the sale of manufactured goods. processed or purchased by these individuals for sale, as well as as a result of performing work or providing services, if these works or services are intended for sale to other individuals and are not used for their own consumption
