

**THE ECONOMICAL SCIENTIFIC COUNTRIES AND SCIENCES****Asrorov Aziz Isomiddin o'g'li****assistant, Samarkand Institute of Economics and service****Xakimov Damir Ulug'bekovich****Student of Samarkand Institute of Economics and service**

**Abstract:** In this article, very important and relevant tools aimed at the formation of faith, the great pedagogical value of determining how to use individual approach methods, scientific knowledge that expands the worldview, the formation of immunity, the specific experience of using historical materials in the education of political vigilance are discussed. was discussed.

**Key words:** the idea of national independence, manifestations of ideologies, formation of faith, political views, national unity, development, educational institutions, great pedagogical value, sincere like-minded, expander.

On top of that, all our resources are in a limited amount of cash, natural resources, skilled labor, means of production, raw materials of consumer goods. It is these limited economic resources that make up the core of the economy to achieve, to find ways to properly distribute resources and products in order to meet the growing extirpation without. Depending on the level of historical progress, the economy may vary in different periods and in different.

Its following types are distinguished:

Depending on the level of coverage, the ham economy can vary. For example, the economy of Jahan, the economy of the country, the national economy, the economy of the network, the economy of the region, the economy of an enterprise or firm, the economy of a family.

They are sometimes rounded up and called macroeconomics and microeconomics.

These types of Economy, their forms, no matter what their raw materials are subject to one goal: to create conditions for the survival, reproduction, and maturation of mankind when it is raw, to create various means of living and satisfying their advantages.

The conclusion is that the economy forms the basis of human life , its foundation, and it itself does not exist without a person, without his activities, and does not lack substance.

The role of innocence in the economy is determined by the fact that it is the highest living being in its nature, that is, by the ability to consciously get creative cocktails depending on a specific goal.

In terms of the cost of resources of man - made goods, services , the economy consists of different phases-the unity of the processes of production , exchange, distribution and consumption.

Inside this, the main thing is the process of manufacturing a waterfall. Because raw goods and services are created at this stage. If there is no production, there will be no exchangeable and quixotic, consumable items that are distributed. Thus commodity and resusr ruin is a process that is constantly repeated without interruption. Social production. The economic activity of people consists of a complex and confusing set of various types of districts and processes , in which economic theory divides four stages: production , distribution, exchange and consumption.

Production is the process of creating material and spiritual blessings necessary for a person to forgive and develop delusions.

Distribution is the process of determining the share (amount, proportions) of the participation of an economic entity in the production of products. Exchange is the process of harakatening material goods and services from one subject to another,

a form of social interaction between producers and consumers , reflecting the social exchange of favors.

Istemol is the process of using production results in order to satisfy certain extents.

All these stages are in interconnection and interrelationship.

Without looking at the fact that products and services are a different district, with a rapid increase, these favors are divided into production advantages : the means of production and the means of production that satisfy the production advantages of society: to the means of production and consumer goods.

In accordance with social production Ham is divided into two divisions: (separated):

Blessings and services that satisfy human extirpations are created in various spheres and networks of social production.

"Social production" is understood as the whole society, that is, production processes that are carried out on a macroeconomic scale.

Social production consists of two Sox associated with each other:

Social Sciences

The production process must be continuous. Its continuity is ensured by the process of reproduction.

Reproduction by nature is of two types: simple and extended. From normal reproduction to year, the gross production yield does not change.

In extended reproduction, the gross national product yield increases year after year. The society has an expanded production. The more gross national product, the higher the standard of living of morality. Part of the gross national product created is used for the renewal and development of production of the rest of the part of the individual eyochto of the society. Investment by nature is of two types: gross investment and net investment Gross investment-is made up of investment goods

directed to renew production. The medium of the activities of the society is the production. Economic resources are used in the production jar, khayotiy favors are created, consisting of products and services.

An economic process, which consists in adapting the beliefs and forces of nature to satisfy human extirpations, is called production.

To start the production process, it is necessary to have production factors (resources).

It is said to the sum of production or service, regardless of the system and form of the economy. The labor force is characteristic of those who have the ability to make cocktails, but the labor force is the ability of a person himself, that is, his cocktail is not Ham.

As a cocktail weapon, a person is told with its help means that affect nature, objects of cocktails. (machines, stanzas, tarktors, equipment, etc.)

Cocktail objects, on the other hand, are those that are directly influenced by the cocktail, that is, the preparation of the product.(earth, water, raw materials and various other materials). Cocktail objects can be found in nature on a ready-made basis, that is, cocktail products of the previous period can be in the form of raw materials.

Cocktail guns and cocktail objects are referred to as co-production tools. This is due to the nature of the cocktail process. For this reason, the means of production of Ham are characteristic of the Hammam social economic systems, the Hammam stages of human development. In the period of technical development of modern science, the relevance of cocktail objects in the development of production is increasing. New types of materials are being created that are not found in nature. While the factors of production are common to the human scallop stages, they give different definitions of these factors in different literature and explain them in different ways.

In the history of the science of the theory of Economics, factors of production have been interpreted in different ways. French economist J.B.Sey based The Theory of the 3 factors of production and introduced land , capital and cocktails into them.

It was noted that production on the basis of their interaction.

K.Marx's doctrine stems from the unity of the 3 factors of ham production. Then he calls them labor force , cocktail objects and tools.

In modern Western countries, large economists advance the concept of an economic resource, introducing land, capital, cocktails and mercenary entrepreneurial abilities into them.

The manifestations of different theory derive from the presence of factors of production, but take different types of hyphens as a basis when interpreting them. In the doctrine of Marxism, the social form of these factors is re-emphasized, taking into account whether they are the castes of exploitation or not.

In other teachings, the role of factors in production as a whole is elated , and their social form is ignored.

This is a joke universal, it was not denied by Marxism Ham.
